

A Universal Proof Framework

Ali Assaf

INRIA Paris-Rocquencourt, Deducteam

Outline

Introduction

A closer look

My work

Whack-A-Bug

```
def binary_search(A, x, left, right):  
    middle = (left + right) / 2  
    if A[middle] > x:  
        return binary_search(A, x, left, middle)  
    elif A[middle] < x:  
        return binary_search(A, x, middle, right)  
    else:  
        return middle
```

Whack-A-Bug

```
def binary_search(A, x, left, right):  
    middle = (left + right) / 2  
    if A[middle] > x:  
        return binary_search(A, x, left, middle)  
    elif A[middle] < x:  
        return binary_search(A, x, middle, right)  
    else:  
        return middle
```

```
A = [2, 3, 5, 7]
```

```
binary_search(A, 7, 0, 3) # Dops!
```

Whack-A-Bug

```
def binary_search(A, x, left, right):  
    middle = (left + right) / 2  
    if A[middle] > x:  
        return binary_search(A, x, left, middle - 1)  
    elif A[middle] < x:  
        return binary_search(A, x, middle + 1, right)  
    else:  
        return middle
```

```
A = [2, 3, 5, 7]
```

```
binary_search(A, 7, 0, 3) # Dops!
```

Proof of correctness

Theorem

*If $x \in A$ and $left \leq right$ and $A[left] \leq x \leq A[right]$
then $A[\text{binary_search}(A, x, left, right)] = x$.*

Proof.

By induction on $(right - left) \dots$

Formal proof

Formal language: $\forall, \exists, \implies, \dots$

Deductive system:

$$\frac{\Gamma, A \vdash B}{\Gamma \vdash A \implies B}$$

$$\frac{\Gamma \vdash A \implies B \quad \Gamma \vdash A}{\Gamma \vdash B}$$

Proof systems

Theoretical systems

- ▶ First-order logic
- ▶ Higher-order logic
- ▶ Calculus of constructions

Proof systems

Theoretical systems

- ▶ First-order logic
- ▶ Higher-order logic
- ▶ Calculus of constructions

Implementations

- ▶ Twelf
- ▶ HOL
- ▶ Coq

Why use them?

In software engineering: eliminate more bugs

- ▶ CompCert project
- ▶ L4.verified project

In mathematics: prove harder theorems

- ▶ 4-color theorem
- ▶ Kepler theorem

Outline

Introduction

A closer look

My work

Two problems

Proof checking:

- ▶ Given a proposition A and a proof \mathcal{D} , does \mathcal{D} prove A ?
- ▶ $Check(\mathcal{D}, A) = \text{Yes or No}$

Two problems

Proof checking:

- ▶ Given a proposition A and a proof \mathcal{D} , does \mathcal{D} prove A ?
- ▶ $Check(\mathcal{D}, A) = \text{Yes or No}$

Proof search:

- ▶ Given a proposition A , does there exist a proof \mathcal{D} of A ?
- ▶ $Search(A) = \mathcal{D} \text{ or None}$

Writing proofs

Theorem foo: forall A B C : Prop,
 (A -> B) -> (B -> C) -> (A -> C) :=

```
fun A B C proof_of_A_B proof_of_B_C =>  
fun proof_of_A =>
```

```
let proof_of_B := (proof_of_A_B proof_of_A) in  
let proof_of_C := (proof_of_B_C proof_of_B) in  
proof_of_C.
```

Writing proofs

Theorem foo: forall A B C : Prop,
 (A -> B) -> (B -> C) -> (A -> C) :=

```
fun A B C proof_of_A_B proof_of_B_C =>  
fun proof_of_A =>
```

```
let proof_of_B := (proof_of_A_B proof_of_A) in  
let proof_of_C := (proof_of_B_C proof_of_B) in  
proof_of_C.
```

Writing proofs

Theorem foo: forall A B C : Prop,
 (A -> B) -> (B -> C) -> (A -> C) :=

```
fun A B C proof_of_A_B proof_of_B_C =>  
fun proof_of_A =>
```

```
let proof_of_B := (proof_of_A_B proof_of_A) in  
let proof_of_C := (proof_of_B_C proof_of_B) in  
proof_of_C .
```

Proof development

1. Write your proof
2. Call the proof checker
3. Checker answers *Yes* or *No* and gives you an error
4. If answer is *No*, go back to step 1

Proof development

1. Write your proof
2. Call the proof checker
3. Checker answers *Yes* or *No* and gives you an error
4. If answer is *No*, go back to step 1

Sounds familiar?

Program development

1. Write your programs
2. Call the compiler
3. Compiler answers *Yes* or *No* and gives you an error
4. If answer is *No*, go back to step 1

Sounds familiar?

Proofs are programs!

Curry-Howard correspondence

Proof	Program
Proposition	Type
$A \implies B$	$A \rightarrow B$
Proof checking	Type checking

Proofs are programs!

Proof system = Programming language

Outline

Introduction

A closer look

My work

A Zoology of proof systems

- ▶ Twelf, HOL, Coq, Isabelle, PVS, NuPRL, Mizar, Agda, ProofPower, Lego, ACL2, ...
- ▶ Different properties
 - ▶ Intuitionistic/Classical
 - ▶ Top-down/Bottom-up
 - ▶ Sequents/Proof terms
 - ▶ ...

Top 100 theorems

HOL Light	86
Mizar	57
Isabelle	51
Coq	49
ProofPower	42
nqthm/ACL2	18
PVS	16
NuPRL/MetaPRL	8

<http://www.cs.ru.nl/~freek/100/>

The need for interoperability

- ▶ CompCert project : 50 000 lines (Coq)
- ▶ Four-color theorem: 60 000 lines (Coq)
- ▶ Jordan curve theorem: 75 000 lines (HOL)
- ▶ Odd order theorem: 170 000 lines (Coq)
- ▶ L4.verified project: 200 000 lines (Isabelle)

The need for interoperability

- ▶ CompCert project : 50 000 lines (Coq)
- ▶ Four-color theorem: 60 000 lines (Coq)
- ▶ Jordan curve theorem: 75 000 lines (HOL)
- ▶ Odd order theorem: 170 000 lines (Coq)
- ▶ L4.verified project: 200 000 lines (Isabelle)

Can we reuse them?

Logical Framework

Idea: Express all these proofs in a common logical framework.

Dedukti

- ▶ Dedukti: means “to deduce” in Esperanto
- ▶ Minimal formalism: $\lambda\Pi$ -calculus modulo =
First-order logic + rewriting

Without rewriting

$$\overline{4 = 4}$$

$$\overline{4 + 1 = 5}$$

$$\overline{4 + 2 = 6}$$

$$\overline{4 + 3 = 7}$$

$$\overline{4 + 4 = 8}$$

With rewriting

$$\begin{aligned}x + 0 &\longrightarrow x \\x + (y + 1) &\longrightarrow (x + 1) + y\end{aligned}$$

With rewriting

$$\begin{aligned}x + 0 &\longrightarrow x \\x + (y + 1) &\longrightarrow (x + 1) + y\end{aligned}$$

$$4 + 4 \longrightarrow^* 8$$

With rewriting

$$\begin{aligned}x + 0 &\longrightarrow x \\x + (y + 1) &\longrightarrow (x + 1) + y\end{aligned}$$

$$4 + 4 \longrightarrow^* 8$$

$$\frac{8 = 8}{4 + 4 = 8}$$

Encodings

- ▶ Adding rewrite rules extends the logic.

Encodings

- ▶ Adding rewrite rules extends the logic.
- ▶ Can express the proofs of a system P in Dedukti.

$$\Gamma \vdash_P A \implies \phi(\Gamma) \vdash_{\lambda\Pi_R} \phi(A)$$

Encodings

- ▶ Adding rewrite rules extends the logic.
- ▶ Can express the proofs of a system P in Dedukti.

$$\Gamma \vdash_P A \implies \phi(\Gamma) \vdash_{\lambda\Pi_R} \phi(A)$$

$$\Gamma \vdash_P A \iff \phi(\Gamma) \vdash_{\lambda\Pi_R} \phi(A)$$

Encodings

- ▶ Adding rewrite rules extends the logic.
- ▶ Can express the proofs of a system P in Dedukti.

$$\Gamma \vdash_P A \implies \phi(\Gamma) \vdash_{\lambda\Pi_R} \phi(A) \quad (\text{Completeness})$$

$$\Gamma \vdash_P A \iff \phi(\Gamma) \vdash_{\lambda\Pi_R} \phi(A) \quad (\text{Soundness})$$

Encodings

- ▶ Need to find a careful balance between *expressivity* and *consistency*.

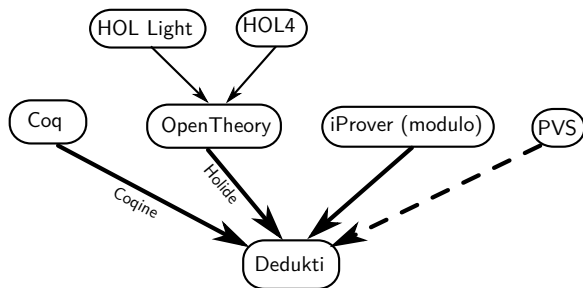

Theorem (Assaf, Cousineau, Dowek)

Any pure type system (PTS) can be encoded in the $\lambda\Pi$ -calculus modulo in a way that is sound and complete.

Implementations

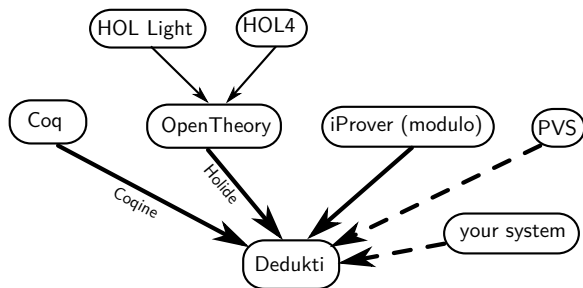

- ▶ Holide: HOL in Dedukti (Assaf, Burel)
- ▶ Coqine: Coq in Dedukti (Assaf, Boespflug, Burel)
- ▶ Focalide: Focalize in Dedukti (Cauderlier, Dubois)
